

LOCK WITH INTERNAL RETAINER

ABSTRACT OF THE DISCLOSURE

5 A locking assembly has two members which are
moveable into coupling engagement with one another. The
two members have lock engaging walls, and one of the
members has an opening between the lock engaging walls
for receiving a lock. The lock comprises a lock body and
a retainer. The lock body has a channel for receiving a
10 portion of the retainer. An end of the retainer extends
underneath a retainer engaging wall, thus resisting
movement of the lock out of the opening.
